

ABSTRACT OF THE DISCLOSURE

A connector includes a plurality of terminals and a connector housing, receiving the terminals. Each of the terminals includes a terminal connecting
5 portion, having a tubular shape, and receiving a mating terminal, a wire press-contacting portion including a press-contacting blade for press-contacting a wire, and the press-contacting blade having a blade width larger than a width of the terminal connecting portion, and an interconnecting
10 portion, connecting the terminal connection portion and a wire press-contacting portion. A press-contacting direction in which the wire is press-contacted with the wire press-contacting portion is parallel to a terminal fitting direction of the terminal connecting portion. The terminal connecting portions of the terminals are received in the connector housing in parallel so that the press-contacting blades are arranged in a staggered manner.

15 Also, a connector includes a housing and a terminal received in the housing. The terminal includes a wire connecting portion which connects a wire and an extension portion which is extended from the wire connecting portion. The extension portion has a conductive portion which is formed in a direction intersecting a direction in which the terminal is inserted into the
20 housing. The housing has an exposure hole through which at least part of the conductive portion is exposed to an exterior.
